Restriction to one of the following inventions is required under 35 U.S.C. § 121:

- I. Claims 1-4 and 7-19, drawn to an optical amplification element and a method of making it, classified in class 359, subclass 344.
- II. Claims 5, 6, and 20-23, drawn to an interferometric optical wavelength converter and a method of using it, classified in class 359, subclass 326.

Inventions II and I are related as combination and subcombination. Inventions in this relationship are distinct if it can be shown that (1) the combination as claimed does not require the particulars of the subcombination as claimed for patentability, and (2) that the subcombination has utility by itself or in other combinations (MPEP § 806.05(c)). In the instant case, the combination as claimed does not require the particulars of the subcombination as claimed because, even using a semiconductor quantum well optical amplifier, the gain spectrum of the amplifier could be controlled by means other than current control (e.g. an optically controlled gain spectrum), and the claimed interferometric optical wavelength converter would operate the same. The subcombination has separate utility such as an in-line amplifier for an optical communication system (not converting wavelengths).

Because these inventions are distinct for the reasons given above and have acquired a separate status in the art as shown by their different classification, restriction for examination purposes as indicated is proper.

Applicant is advised that the reply to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed (37 CFR § 1.143).

Any inquiry concerning the merits of this communication should be directed to Examiner John D. Lee at telephone number (703) 308-4886.
